face-infusion

Advanced system for the infusion of topical agents, improved by a simultaneous skin microdermabrasion

Face Infusion synergically combines microdermabrasion and the controlled transdermal delivery of active ingredients.

The special head with circular diamond crown carries out abrasion via mechanical micropulsations and at the same time releases topical agents, which are delivered by the microcurrents to the deepest layers of the skin.

Face Infusion allows a non-invasive, pain-free, transcutaneous delivery of the active ingredients in order to eliminate or correct certain pathologies of the skin that originate in the epidermis and in the uppermost layers of the dermis. For ever young, healthy looking skin.

- Thanks to the special head with circular, diamond crown, Face Infusion allows superficial exfoliation of the stratum corneum and the removal of oils and sebaceous matter thus increasing the permeability of the skin.
- The micropulsations simultaneously improve the abrasive action of the diamond circular crown, stimulating both the receptors beneath the layer of skin dedicated to the vascularisation of the skin and the secondary fibroblasts which produce new collagen.
- There are four sets of serum available, containing unique and effective ingredients for each of the various treatments.
